

Project ID	Project Title	Tr Description	TA	Max Team Size
1	Priority-Based Routing for Quality of Service in Quantum Networks	<p><b>Description</b> – Implement priority-based routing for quantum networks by extending path selection algorithms to account for differentiated QoS and users.</p> <p><b>Tools</b> – Quantum network simulators (e.g. SquidQSM, NetSquid, SeQuINce), Python, routing algorithms with priority handling.</p> <p><b>Expected Outcomes</b> – Implementation of QoS-aware quantum routing, providing differentiated performance for high-priority users.</p> <p><b>Reference</b> – <a href="https://arxiv.org/abs/2202.07001">https://arxiv.org/abs/2202.07001</a></p>	Malika	5
2	Quantum BGP: Online Path Selection through Network Benchmarking	<p><b>Description</b> – Implement and reproduce results of Quantum BGP protocol with online benchmarking-based path selection, ensuring efficient and adaptive routing in quantum networks.</p> <p><b>Tools</b> – Quantum network simulators (e.g. SquidQSM, NetSquid, SeQuINce), Python, routing protocol implementation.</p> <p><b>Expected Outcomes</b> – Validation of Quantum BGP with benchmarking, showing adaptive online path selection that improves routing efficiency in quantum networks.</p> <p><b>Reference</b> – doi: 10.1109/INFCOMMS122.2024.10621399</p>	Malika	5
3	Understanding Host Network Stack Overheads	<p><b>Description</b> – Implement and evaluate host network stack. Analyze and reproduce the results published in the paper and extend the evaluation with various other scenarios.</p> <p><b>Tools</b> – Network traffic generator (packet analysis), Python/Java (traffic generation and automation), Linux networking utilities.</p> <p><b>Expected Outcomes</b> – Validation of published results, along with extended evaluation that highlights the impact of different network conditions and configurations on performance.</p> <p><b>Reference</b> – <a href="https://arxiv.org/abs/2405.07996">https://arxiv.org/abs/2405.07996</a> [4727888]</p>	Malika	5
4	SDN-based Network Automation for Traffic Management	<p><b>Description</b> – Create a SDN Northbound Application that can automatically reconfigure the network routing based on real-time traffic patterns.</p> <p><b>Tools</b> – Mininet, ONOS (development), Mininet-IP (network emulation).</p> <p><b>Expected Outcomes</b> – Validation of adaptive routing through ONOS, demonstrating reduced contention and improved throughput under varying traffic loads compared to static routing.</p> <p><b>Reference</b> – <a href="https://arxiv.org/abs/2405.07996">https://arxiv.org/abs/2405.07996</a> [4727888]</p>	Malika	5
5	Cross-Simulator Exploration of Quantum Network Applications	<p><b>Description</b> – Implement a cross-simulator quantum network application (e.g., routing, QKD, entanglement swapping, teleportation) across multiple simulators to explore and compare their features. The goal is to demonstrate how the same application behaves differently across different simulators and to support user-driven research.</p> <p><b>Tools</b> – SquidQSM, NetSquid, SeQuINce, SimulaQron, or other relevant quantum network simulators.</p> <p><b>Expected Outcomes</b> – Side-by-side implementation across at least three simulators, comparative results on performance, documentation of strengths and weaknesses, and a recommendation package for future exploration.</p> <p><b>Reference</b> – <a href="https://github.com/sequence-toolbox/SeQuINce">https://github.com/sequence-toolbox/SeQuINce</a>  <a href="https://github.com/ONI-Tech/DeCoNet">https://github.com/ONI-Tech/DeCoNet</a></p>	Malika	5
6	Simulation Platform for Distributed Quantum Computation	<p><b>Description</b> – Build a simulator for distributed quantum computing by interconnecting quantum processors through a network simulation framework. The objective is to model realistic quantum systems and their interaction over quantum networks, enabling the study of distributed quantum computing.</p> <p><b>Tools</b> – Qiskit, SquidQSM, NetSquid, SeQuINce, SimulaQron, or other relevant quantum network simulators.</p> <p><b>Expected Outcomes</b> – A functional simulation of distributed quantum computing with multiple networked quantum processors; demonstration of example tasks such as entangler-based quantum circuit synthesis or error correction algorithms, and comparison of the chosen simulators and implementation process.</p> <p><b>Reference</b> – <a href="https://arxiv.org/abs/2204.11795">https://arxiv.org/abs/2204.11795</a> [2204.11795]</p>	Malika	5
7	C++/Python Coding Ground	<p><b>Description</b> – Develop an interactive online platform to host competitive programming, coding challenges, and technical assessments. The platform should support multiple roles (assessor and participant), provide a user-friendly interface, and provide features to build, compile, and run code online.</p> <p><b>Tools</b> – Python, C++, Docker, Docker sandbox, PostgreSQL</p> <p><b>Expected Outcomes</b> – A fully functional coding platform with role-based access, support for multiple users, problem hosting and evaluation features, real-time code execution and feedback, and an extensive assessment component using HackerRank or CodeChef.</p> <p><b>Reference</b> – <a href="https://arxiv.org/abs/2204.11795">https://arxiv.org/abs/2204.11795</a></p>	Malika	4
8	Ultra Fast Packet Crafting Utility: Bitzing	<p><b>Description</b> – This project ports Bitzing to DPDK for high-speed packet crafting and adds hardware memory access, implement TTL-based tracebacks with precise timing measurements, and build a memory access module for fast memory access. The project will also include performance improvements over standard networking utilities through hardware-accelerated packet handing.</p> <p><b>Tools</b> – DPDK, Intel PMD drivers, Hugetools, NUMA libraries, Mininet, Raw sockets, Libpcap, Wireshark, perf, Python, C/C++.</p> <p><b>Expected Outcomes</b> – Learn how to speed up packet processing using DPDK by building a high-performance packet crafting tool. Compare the performance of DPDK-based tools with traditional networking applications.</p> <p><b>Reference</b> – <a href="https://doi.org/10.1016/j.cose.2020.07.040">https://doi.org/10.1016/j.cose.2020.07.040</a></p>	Naveen	5
9	P4-Based Programmable Data Plane	<p><b>Project Description</b>: This project designs a custom packet processing system using the P4 programming language, combining IPv4 Segment Routing (SRv6) for flexible source-based routing and In-band Network Telemetry (INT) to capture real-time packet loss such as latency and queue length. The system will be evaluated against traditional routing approaches to demonstrate speed, efficiency, and overhead, highlighting how programmable hardware can enhance routing, and potentially network performance.</p> <p><b>Tools/Technologies</b>: C/C++ / Python / Go      Networking: TCP/UDP, RPC or gRPC      Simulation: Mininet / Docker</p> <p>The project will provide insights into how file system operations behave over networks, the impact of caching and replication on latency and throughput, and how multiple clients affect scalability. It will also demonstrate how client-side compression affects performance.</p>	Naveen	5
10	Network File System(NFS)	<p><b>Project Description</b>: Implements a Distributed Network File System (NFs) that enables clients to remotely access and manage files over a network. The system follows a client-server model, supports multiple concurrent clients, and integrates features such as client-side caching with local file systems to improve performance. The performance of the implemented system will be benchmarked against local file systems to evaluate latency, throughput, and scalability.</p> <p><b>Programming</b>: C/C++ / Python / Go  <b>Networking</b>: TCP/UDP, RPC or gRPC  <b>Simulation</b>: Mininet / Docker</p> <p>The project will provide insights into how file system operations behave over networks, the impact of caching and replication on latency and throughput, and how multiple clients affect scalability. It will also demonstrate how client-side compression affects performance.</p>	Naveen	5
11	Network Telemetry Framework	<p><b>Project Description</b>: Develop a standardized framework to collect, transport, and visualize network performance metrics, such as bandwidth usage and latency from routers and switches in real time. The system gathers metrics at regular intervals, streams them to a central backend, and processes them to generate reports and dashboards. Telemetry data can be analyzed to identify latency issues, and quickly respond to performance problems.</p> <p><b>Tools/Technologies</b>: Python, Java, Go, GRPC, SNMP, REST APIs, OpenTelemetry, Grafana, or other frameworks like n3.js or custom-built network models.</p> <p><b>Expected Outcomes</b> – A dashboard displaying real-time monitoring dashboards that display the bandwidth utilization and latency trends across devices.</p> <p>A dashboard for reporting performance issues (e.g., high bandwidth usage or latency spikes). Bandwidth data access and export through REST APIs for reporting and integration.</p> <p>A modular and scalable system that can be extended to support more devices or metrics without significant changes to the core architecture.</p>	Eka	5
12	Network Congestion Control Simulator	<p><b>Project Description</b>: Create an interactive simulation platform that demonstrates how different TCP congestion control algorithms work under varying network conditions, such as bandwidth, latency, and packet loss. The platform provides visualization of throughput, congestion window changes, and retransmission behavior.</p> <p><b>Tools/Technologies</b>: Python, JavaScript, React for GUI; Matplotlib for graphs; simulation frameworks like n3.js or custom-built network models.</p> <p><b>Expected Outcomes</b> – An interactive environment for TCP algorithms (e.g., Reno, Cubic, BBR). Real-time graphs showing throughput and congestion window evolution. Animated timeline depicting packet traces and state transitions.</p>	Eka	2
13	Interactive DNS Query & Resolution Monitor	<p><b>Project Description</b>: Develop a tool to simulate and visualize the DNS resolution process. Users can input domain names and type queries to see the flow of requests and responses. The tool visualizes the process in real-time, showing query, recursive caches, resolvers, and authoritative servers.</p> <p><b>Tools/Technologies</b>: Python, JavaScript, React, D3.js, Node.js for backend; DNS libraries like dnspython, pydig3.</p> <p><b>Expected Outcomes</b> – Step-by-step graphical representation of DNS resolution. Simulation of failures like server downtime and DNSSEC validation.</p> <p>Implementation of caching, Dot, Dot+ and DNSSEC.</p> <p>Simulation of failures like server downtime and DNS poisoning.</p> <p>Implementation of DNS load balancing and failover mechanisms.</p>	Eka	2

14	Per-Process Bandwidth Tracker using eBPF	<p>Build a real-time network usage tracker using eBPF to measure send/receive bandwidth per process. Support per-remote IP tracking, protocol filtering (TCP/UDP), and historical usage storage for trending.</p> <p><b>Tools</b></p> <ul style="list-style-type: none"> <li>Linux eBPF (bcc / libbpf)</li> <li>C/C++ (user-space program)</li> <li>SQLite / Prometheus (storage)</li> <li>CLI or simple Web UI</li> </ul> <p><b>Expected Outcomes:</b></p> <ul style="list-style-type: none"> <li>Real-time per-process bandwidth monitoring</li> <li>Real-time per-process + per-IP bandwidth monitoring</li> <li>Protocol-based filtering (TCP/UDP)</li> <li>Historical bandwidth storage</li> </ul>	Yasir	4				
15	Packet Monitor	<p>Build an eBPF-based tool to trace where and why packets are dropped in the Linux networking stack. Use tracemonitors like net_dev_xmit, kfree_skb, and skb_drop to capture drop events and probe insights.</p> <p><b>Tools</b></p> <ul style="list-style-type: none"> <li>Linux eBPF (tracemonitors)</li> <li>bcc (C/C++)</li> <li>Go or Python (user-space program)</li> <li>CLI or simple dashboard for visualization</li> </ul> <p><b>Expected Outcomes:</b></p> <ul style="list-style-type: none"> <li>Understand Linux networking internals</li> <li>Identify prese drop points and reasons</li> <li>Provide real-time drop monitoring for debugging and performance tuning</li> </ul>	Yasir	4				
16	Modifying Southbound Communication protocol in SDN: TCP to UDP for (Ryu+OVS)	<p>Modify Ryu's southbound communication (OVS) to use UDP instead of TCP for OpenFlow southbound communication. Implement basic reliability (acknowledgments/retransmissions) or operate in "best-effort" mode to study trade-offs in latency, performance, and failure handling.</p> <p><b>Tools</b></p> <ul style="list-style-type: none"> <li>Ryu SDN Controller (Python)</li> <li>Open vSwitch (C codebase)</li> <li>Wireshark (for packet analysis)</li> <li>Mininet for testing</li> </ul> <p><b>Expected Outcomes:</b></p> <ul style="list-style-type: none"> <li>Understand Ryu+OVS communication internals</li> <li>Model different protocols for OpenFlow messages</li> <li>Compare TCP vs. UDP trade-offs (latency, reliability)</li> <li>Prototype "UDP-based OpenFlow" for experimentation</li> </ul>	Yasir	5				
17	Energy Monitor using e-Bpf	<p>Monitor system wide kernel events (process scheduling, context switches, network I/O) to collect fine-grained resource usage metrics (time, CPU cycles, etc.). Combine these with power models (RATP counters, CPU frequency scaling) to estimate per-process energy consumption. Stream the data to a visualization layer (web or CLI) to display real-time usage and trends.</p> <p><b>Tools</b></p> <ul style="list-style-type: none"> <li>Linux eBPF (tracemonitor, perf events)</li> <li>Python (user-space program)</li> <li>Go or Python (collector + dashboard backend)</li> <li>Web UI or CLI dashboard for visualization</li> </ul> <p><b>Expected Outcomes:</b></p> <ul style="list-style-type: none"> <li>Understand Linux CPU and I/O events</li> <li>Estimate real-time per-process energy consumption</li> <li>Visualize real-time energy consumption trends</li> <li>Prototype "per-process energy monitor" for Linux</li> <li>Dockerize the tool for easy deployment and distribution</li> </ul>	Yasir	5				
18	Securing Ryu+OVS Southbound Communication with Post-Quantum Cryptography	<p>Implement a quantum-resistant TLS implementation from NIST PQC standards into the Ryu+OVS southbound channel. Replace or augment classical TLS key exchange and authentication with PQC primitives to create a quantum-resistant SDN control plane. Evaluate performance and overhead compared to standard TLS.</p> <p><b>Tools</b></p> <ul style="list-style-type: none"> <li>Ryu SDN Controller (Python)</li> <li>Open vSwitch (C codebase)</li> <li>PQC libraries (e.g., liboqs, Open Quantum Safe, pqcrypto)</li> <li>Mininet for SDN testing</li> <li>Wireshark for TLS traffic verification</li> </ul> <p><b>Expected Outcomes:</b></p> <ul style="list-style-type: none"> <li>Understand Ryu+OVS southbound TLS communication internals</li> <li>Implement PQCsecured OpenFlow channel</li> <li>Compare encryption approaches (TLS vs PQC) with classical TLS</li> <li>Prototype a quantum-resistant SDN southbound communication channel</li> </ul>	Yasir	6				
19	Exploring Model Context Protocol (MCP) for Networked AI Applications	<p><b>Project Description:</b> This project involves building a Model Context Protocol (MCP)-compliant server that exposes model configuration, status, &amp; DNS lookup, transparently using its callback functions. The core focus is connecting this server to an MCP-enabled client to demonstrate how natural language commands can execute these tools and return structured data, enabling AI-assisted network analysis and management. Use Hyp SSL for connection and deploy server on cloud.</p> <p><b>Tools/Techologies:</b></p> <ul style="list-style-type: none"> <li>MCP frameworks (Anthropic MCP SDK, FastMCP), server framework (FastAPI, Python), network diagnosis tools (Wireshark, ping, traceroute, ping6), clients (Claude Desktop, custom terminal client), development tools (Docker, Git)</li> </ul> <p><b>Expected Outcomes:</b></p> <ul style="list-style-type: none"> <li>A functional MCP server with API endpoints for core network operations</li> <li>A functional MCP client demonstrating natural language-driven tool invocation</li> <li>Demonstration of structured data exchange between AI systems and network tools</li> <li>Analysis of MCP's benefits for standardizing AI-tool interactions and improving contextual understanding</li> </ul>	Harsh	4				
20	Intelligent Network Configuration Automation using MCP and Rule-based Automation	<p><b>Project Description:</b> This project builds an intelligent assistant using MCP that helps network administrators configure devices securely and efficiently. It interprets user commands and applies configurations like firewall rules and bandwidth limits based on predefined policies and network context.</p> <p><b>Tools/Techologies:</b></p> <ul style="list-style-type: none"> <li>MCP (Anthropic MCP SDK), network tools ("iptables", "tc"), scripting (Python, Bash), configuration files (YAML/JSON), monitoring tools ("ping", "iperf3"), Docker for deployment</li> </ul> <p><b>Expected Outcomes:</b></p> <ul style="list-style-type: none"> <li>Apply network configurations from user commands</li> <li>Use rule-based automation for secure and optimized settings</li> <li>Deployment of the MCP server and client, test cases, and validation results</li> <li>A final report explaining setup, use cases, and validation results</li> </ul>	Harsh	5				
21	DNS over HTTPS (DoH) vs DNS over TLS (DoT): Performance & Privacy	<p><b>Project Description:</b> This project sets up a test environment to compare DNS-over-HTTP(S) (DoH) and DNS-over-TLS (DoT) with traditional DNS. It focuses on measuring differences in latency, bandwidth overhead, and privacy by analyzing how resistant each method is to eavesdropping and packet inspection.</p> <p><b>Tools/Techologies:</b></p> <ul style="list-style-type: none"> <li>Testbed setup with DNS servers supporting DoH, DoT, and plain DNS Network analysis tools (Wireshark, tcpdump)</li> <li>Web browsers and benchmarking tools for page load measurement (Traffic generator, curl, wget)</li> </ul> <p><b>Expected Outcomes:</b></p> <ul style="list-style-type: none"> <li>Measure lookup and page load latency</li> <li>Analyze bandwidth overhead of encrypted DNS</li> <li>Evaluate privacy through packet inspection</li> </ul>	Harsh	5				
22	Multi-Path QUIC (MP-QUIC) vs MPTCP Performance and Reliability Evaluation	<p><b>Project Description:</b> Study and compare MP-QUIC and MPTCP protocols for applications like video streaming, file transfer, and VoIP focusing on throughput, latency, and connection stability.</p> <p><b>Tools/Techologies:</b></p> <ul style="list-style-type: none"> <li>QUIC implementation: quick-go, Cloudflare's quick-go, or similar</li> <li>MPTCP implementation: NetInn, Mininet</li> <li>Monitoring: Wireshark, NetworkMiner</li> </ul> <p><b>Expected Outcomes:</b></p> <ul style="list-style-type: none"> <li>Measure throughput, latency, and reliability under different network conditions</li> <li>Analyze how each protocol handles packet loss and congestion</li> <li>Gain practical experience configuring multipath protocols</li> <li>Provide recommendations for protocol use based on application needs</li> </ul>	Harsh	5				

23	SLA-Aware Autoscaler (Prototype with Queue Depth Metric)	<p><b>Project Description:</b> Build a Kubernetes-based custom autoscaler for FlexRIC Apps that scales pods based on queue depth. Set up a script in FlexRIC to export queue depth (number of pending E2E messages). Collect metrics with Prometheus. Write a controller (Python Go, or use keda) that scales pods when queue depth &gt; threshold. Compare performance with default HPA (CPU-based).</p> <p><b>Tools:</b></p> <ul style="list-style-type: none"> <li>FlexRIC/ONF-SDRAN (near-RT RIC SOK), Kubernetes + Prometheus, Python/Go for controller</li> </ul> <p><b>Expected Outcome:</b></p> <ul style="list-style-type: none"> <li>Working autoscaler that reacts faster than CPU-based scaling.</li> <li>Graphs showing reduced SLA violations (lower queueing delay).</li> </ul>	Ayushman	6							
24	Extending Kubernetes Self-Healing for Networking Failure	<p><b>Project Description:</b> Extend Kubernetes self-healing features like restarting failed pods or rescheduling workloads when nodes go down. However, it does not automatically recover from networking-related failures such as CN plugin crashes, CoreNDS issues, or broken network interfaces. In this project, a custom Kubernetes operator/controller will be developed to detect and fix such failures.</p> <p><b>Tools:</b></p> <ul style="list-style-type: none"> <li>CNI plugin health (Calico/Fannel pods)</li> <li>DNS health (CoreNDS latency and failures)</li> <li>Pod-to-pod connectivity (via periodic probes)</li> <li>Network interface monitoring (available services)</li> </ul> <p><b>When a problem is detected:</b> the operator will apply automated remediation e.g., restarting pods, reapplying NetworkPolicies, or switching to a backup DNS configuration.</p> <p><b>Tools:</b></p> <ul style="list-style-type: none"> <li>Kubernetes (Minikube/KIND)</li> <li>Prometheus for health metrics + Alertmanager</li> <li>Python (client/gRPC) / Go (Kubebuilder) for operator development</li> <li>Calico/Fannel/CNI for available services</li> <li>Loki/Grafana for log monitoring (optional)</li> </ul> <p><b>Expected Learning Outcomes:</b></p> <ul style="list-style-type: none"> <li>Understand limits of Kubernetes built-in self-healing</li> <li>Learn how to extend Kubernetes self-healing features to handle networking failures</li> <li>Develop hands-on experience with Kubernetes monitoring and troubleshooting stack</li> <li>Gain hands-on experience with Kubernetes monitoring and troubleshooting stack</li> </ul>	Ayushman	6							
25	Dynamic UE Handover Simulation using sr5AN	<p><b>Project Description:</b> Students will learn how to simulate handovers in 5G networks. In this project, a UE (emulated) will move between two gNodeBs in an sr5AN setup. Students will simulate handover events and analyze key network performance metrics such as handover delay, packet loss, and signaling overhead. This project helps students understand how mobility is managed in real 5G networks and how service continuity is maintained.</p> <p><b>Tools:</b></p> <ul style="list-style-type: none"> <li>sr5AN (gNB + UE emulation)</li> <li>URRANSIM (mobility and handover simulation)</li> </ul> <p><b>Learning Outcome:</b></p> <ul style="list-style-type: none"> <li>Measured handover delay and packet loss during UE movement</li> <li>Signaling overhead analysis during handover</li> <li>Visualization of handover events and network activity</li> <li>Understanding of handover management and its impact on 5G</li> <li>Gain hands-on experience with sr5AN and mobility emulation</li> <li>Quantity network performance metrics under mobility conditions</li> </ul>	Ayushman	4							
26	Simulation of 5G MTN (Non-Terrestrial Networks) Using Open-Source Tools	<p><b>Project Description:</b> This project focuses on simulating 5G networks over satellite-based links (GEO and LEO). Students will emulate satellite-induced delay and Doppler effects on 5G traffic and validate them against theoretical modeling. The aim is to compare terrestrial, GEO, and LEO links in terms of latency, throughput, and reliability, highlighting the challenges of non-terrestrial communication in 5G networks.</p> <p><b>Tools:</b></p> <ul style="list-style-type: none"> <li>sr5AN → gNB and UE emulation</li> <li>Open-Space Channel Emulator → To generate channel models for satellite links</li> <li>GNU Radio + LimeSpectrum → To emulate satellite delay and Doppler effects</li> <li>Wireshark + iperf → Traffic capture and performance measurement</li> <li>MATLAB → Analytical modeling of GEO and LEO link delay and Doppler</li> </ul> <p><b>Learning Outcome:</b></p> <ul style="list-style-type: none"> <li>Measured latency, throughput, and reliability for terrestrial, GEO, and LEO links</li> <li>Doppler effect analysis on different non-terrestrial platforms</li> <li>Comparison of latency, throughput, and reliability of satellite links</li> <li>Understand non-terrestrial network challenges in 5G</li> <li>Gain hands-on experience with satellite link emulation and validation</li> <li>Gain hands-on experience with non-terrestrial network performance</li> </ul>	Ayushman	6							
27	Doppler Shift Analysis in LEO, MEO, and HAPS	<p><b>Project Description:</b> Mobility and relative motion introduce Doppler shifts in non-terrestrial wireless links, which affect signal quality. In this project, students will model and analyze Doppler shift for LEO satellites, MEO satellites, and HAPS (High Altitude Platform Stations). They will calculate Doppler frequency offsets based on altitude, velocity, and carrier frequency, and study the effect of relative motion on signal quality. The project also involves analyzing HAPS links in terms of frequency offsets, latency, and potential symbol errors, and discuss mitigation strategies such as frequency tracking or adaptive equalization.</p> <p><b>Tools:</b></p> <ul style="list-style-type: none"> <li>MATLAB / Python → For Doppler calculation, plotting Doppler vs time, and analytical modeling</li> <li>GNU Radio + iperf3n (optional) → To simulate communication links under Doppler effects</li> <li>GMAT (optional) → To generate realistic satellite orbits and velocities</li> <li>Wireshark / iperf → To capture and measure network traffic if simulating signal-level effects</li> </ul> <p><b>Learning Outcomes:</b></p> <ul style="list-style-type: none"> <li>Graphs of Doppler shift vs time for LEO, MEO, and HAPS platforms</li> <li>Maximum Doppler shift comparison for different altitudes and carrier frequencies</li> <li>Doppler shift analysis for LEO, MEO, and HAPS platforms</li> <li>Analysis of Doppler mitigation techniques like frequency tracking or adaptive equalization</li> <li>Understand the effect of relative motion on wireless signals in NTN environments</li> <li>Understand the challenges of non-terrestrial networks and their impact on latency, throughput, and error rate</li> <li>Learn how Doppler affects network performance (latency, throughput, error rate)</li> <li>Gain experience in modeling and analyzing non-terrestrial wireless networks, bridging theory and simulation</li> </ul>	Ayushman	6							
28	SmartGuard	<p><b>Project Description:</b> Develop a centralized monitoring system that collects and analyzes real-time data from various sensors. The system should be able to handle data from multiple sensors in classrooms and labs. Using a network of simulated sensor clients (via Mininet), data is transmitted to a central node where a dashboard presents the data in a graphical format. The system also includes a heatmap visualization module that compares across rooms, sensor graphs for tracking historical trends, and anomaly detection alerts for cases such as high CO levels, low light, or overheating. The system should be designed to be highly scalable and efficient, supporting large amounts of time-series data. Use standard protocols like MQTT.</p> <p><b>Tools:</b></p> <ul style="list-style-type: none"> <li>Mininet, MQTT Protocol, Python/Node.js for backend data collection, InfluxDB/TimescaleDB for storing time-series data, Grafana/Riot Dash for dashboards and heatmaps.</li> </ul> <p><b>Expected Outcomes:</b></p> <ul style="list-style-type: none"> <li>Students build a centralized dashboard and learn about MQTT protocol for sensors and build a scalable architecture that can handle data from let say 100 sensors.</li> </ul>	Naveen	4							
29	Traffic Prediction + Energy-Aware Link Activation in SDN	<p><b>Project Description:</b> Develop a system that predicts traffic patterns and identifies segments that reduce energy consumption in a 5G backhaul by predicting per-link traffic and dynamically putting under-utilized links to sleep without hurting throughput. Using historical traffic data and machine learning models (e.g., LSTM) predictions are made for the next time slot. An SDN controller (Ryu or ONOS) in a network-emulated backhaul topology uses those predictions to keep only the minimum set of active links required to satisfy the traffic demand. The system measures energy saved, throughput maintained, and changes in link utilization.</p> <p><b>Tools:</b></p> <ul style="list-style-type: none"> <li>Mininet (network emulation), SDN controller Ryu or ONOS, Traffic datasets: public 4G/5G flow/trace datasets, Measurement/evaluation Matplotlib + Grafana + Plotly</li> </ul> <p><b>Expected Outcome:</b></p> <ul style="list-style-type: none"> <li>Student build the prototype and analyze the metrics like % Energy Saved, % Throughput</li> <li>Link utilization</li> </ul> <p><b>Project Description:</b> Build an eBPF-based monitor that watches a small set of syscalls often used in privilege escalation (execve, setuid/setgid, prctl) and streams lightweight event records to a user-space agent. The agent then performs analysis, raises alerts, and triggers actions to prevent privilege escalation. The system can outcome trigger container actions (e.g., kill or suspend a process). The aim is fast, low-overhead detection and basic mitigation with useful forensic context.</p> <p><b>Tools / Technologies:</b></p> <ul style="list-style-type: none"> <li>eBPF toolkit: clang/llm, bpftrace, libbpf (or BCC for faster prototyping)</li> <li>User-space agent: Python (async) or Go (read ring buffer, analyze, raise alert)</li> <li>Testing: HTTP POST requests to the collector via simple POST</li> <li>Dashboard/storage: Elastic/InfluxDB + Grafana or simple Flask + SQLite for logs</li> <li>Testing: VM containers, namespaces to validate behavior</li> </ul> <p><b>Expected Outcomes:</b></p> <ul style="list-style-type: none"> <li>Low-overhead eBPF probes that capture target syscalls</li> <li>Real-time alerts to a remote collector</li> <li>Basic anomaly detection rules with measurable true/false positive observations on test scenarios.</li> <li>Forensic logs (process, parent, timestamp, binary ID) to investigate incidents.</li> </ul>	Yasir	5							
30	SBPFIOS - System Intelligence		Sameer	6							

31	DNS Resolver using AF_XDP	<p><b>Project Description:</b> This project implements a DNS resolver that sends and receives DNS requests over AF_XDP sockets. It uses a user-space resolver to receive raw Ethernet IP+UDPLDNS frames, transmits them via the XSK TX ring, and receives responses via the XSK RX ring. The XSK interface provides low-latency, high-throughput packet I/O, zero-copy packet handling tradeoffs, and the extra plumbing required (MEM, rings, descriptor management) compared to conventional sockets.</p> <p><b>Tools / Technologies:</b></p> <ul style="list-style-type: none"> <li>Linux kernel AF_XDP / XDP support (recent kernel)</li> <li>cumulus Linux (optional)</li> <li>libibverbs (optional)</li> <li>libibv / libxsk (or equivalent XSK helper code) for user-space XSK setup</li> <li>C user-space resolver for packet crafting and XSK ring handling</li> <li>perfetto (optional)</li> <li>tcpdump / Wireshark / pktgen (for validation and packet inspection)</li> </ul> <p><b>Expected Outcome:</b></p> <ul style="list-style-type: none"> <li>Concurrent AF_XDP sockets measurements of latency, throughput, and CPU overhead showing AF_XDP tradeoffs (zero-copy performance benefits vs implementation complexity).</li> </ul>	Ayushman	4				
32	Digital Twins for Large Scale Data Center Networks	<p><b>Project Description:</b> In this project, you will explore and simulate the networking infrastructure of a data center. You will learn how to collect network traffic, analyze it, and build a digital twin of the network, focusing on key components such as routers, switches, servers, and links. The goal is to simulate and visualize network traffic, latency, bandwidth usage, and failure scenarios to optimize network performance and reliability. This project will help you understand the complex nature of data center networks and build any networking scenario like, use of machine learning to predict network traffic patterns and anomalies, security analysis, and more. You will also learn about various security aspects like DDoS attacks, firewall configurations, or encrypted traffic analysis into the network model.</p> <p><b>Tools / Technologies:</b> NVIDIA AI Access (Register for a Developer Account) Python</p> <p><b>Expected Outcome:</b></p> <ul style="list-style-type: none"> <li>Learn network basics and develop a fully functional Digital Twin Model for network simulations.</li> <li>Demonstrate the Digital Twin and insights on traffic monitoring, prediction or security analysis.</li> </ul>	Sameer	2				
33	SoNIC Application for Traffic Engineering	<p><b>Project Description:</b> Software for Open Networking in the Cloud (SoNIC) is an open source framework for building network functions and services on commodity hardware (CPU, memory, and ASICs). In this project, you will work on the SoNIC NOS and build a traffic monitoring system using the SoNIC framework. The goal is to implement a traffic monitoring system on the SoNIC NOS to optimize for latency, bandwidth, or fault tolerance.</p> <p><b>Tools/Technologies:</b> SoNIC, Open vSwitch, ONOS Controller, Packethandler, Controllers like TRex, Fitter, Open vSwitch, Open vRAN, Open vBTS, Open vEPC, etc.</p> <p><b>Expected Outcome:</b></p> <ul style="list-style-type: none"> <li>Implement a traffic monitoring system that monitors network traffic statistics (packet counts, bandwidth utilization, etc.) and build a system that analyzes traffic patterns and alerts administrators when there are any potential security issues (e.g., DDoS attacks, abnormal traffic spikes) are detected.</li> </ul>	Sameer	3 + 1				
34	Efficient Protocol Analysis using DPU	<p><b>Project Description:</b> This project implements an inline protocol security monitor for PFCP (control plane of 5G) on a BlueField DPU (Data Processing Unit). The DPU is inserted between SMF-UPE (for PFCP) and GNB-UPE (for GTP-U), where it parses live packets at line rate. A modular parser extracts key fields (SEIDs, PDR/FA in PFCP; TESID, TFI, TID, TAC, TAI, TMSI, etc. in GTP-U) and performs various checks like session hijacking, malformed rules, TED guessing, and tunnel hijacking. Malicious traffic is dropped or flagged. All the data is sent to a telemetry collector. The project demonstrates low-latency protocol parsing on DPUs and quantified CPU overhead benefits compared to CPU-only monitoring.</p> <p><b>Tools / Technologies:</b></p> <ul style="list-style-type: none"> <li>NVIDIA BlueField DPU (BF-2) SDK</li> <li>DPDK / eBPF/XDP for fast packet parsing and filtering</li> <li>C (CPU user-space applications) for protocol parsing and rule engine</li> <li>FreeSGC or OpenSGS (Core) to generate PFCP traffic</li> <li>oaiRAN or OAI (RAN) to generate GTP-U tunnels</li> <li>Wireshark / tshark / Scapy for packet injection, attack simulation, and validation</li> </ul> <p><b>Expected Outcome:</b></p> <ul style="list-style-type: none"> <li>Working PFCP and GTP-U protocol parsers on the DPU</li> <li>Inline detection of at least 3 attack types: PFCP session hijacking, malformed PDR/FAR injection, GTP-U TED Hijacking</li> <li>Measurement of latency overhead and CPU utilization with/without GPU offload</li> </ul>	Ayushman	5				
35	Network Monitoring: OpenTelemetry vs SNMP	<p><b>Project Description:</b> compare and integrate two major observability tools: OpenTelemetry and Simple Network Management Protocol (SNMP). To monitor and observe the performance and health of the network, we will use both of these tools. We will compare their pros and cons, and see how metrics, and ultimately, how they can be used together or separately to improve network monitoring.</p> <p><b>Tools and Technologies:</b> OpenTelemetry SDK and Collector, SNMP v2 or v3, Prometheus and Grafana for monitoring front-end dashboard. Network tools like Mininet and GNS3.</p> <p><b>Expected Outcome:</b> Understanding of OpenTelemetry and SNMP for network monitoring. Real-time visualization of the application performance and network device metrics. Comparative analysis of the two tools in terms of data collection, integration complexity, and visualization.</p>	Sameer	4				
36	Grade Management Tool	<p><b>Description:</b> Develop a Grade Management Tool that facilitates managing grades. The system allows students to upload grade matrix for their respective courses, specifying the weightage of various assignments and quizzes. Students can view their grades and download reports. Administrators can upload student scores for each assessment. Students can securely select their courses and view their grades. Administrators can enter new courses. The system aims to enhance efficiency, improve the grading process, and ensure privacy in grade sharing.</p> <p><b>Features:</b> Instructor Dashboard - to create and update courses, set the grade matrix (components like #Quizzes, Assignments, Exams, Attendance, etc with respective weightage(%)) and upload the grade matrix for the respective courses. Student Dashboard - to facilitate students to register for the courses and view the grades achieved in their respective courses.</p> <p><b>Optional:</b> Grade calculator with distinct roles for Student/Instructor Login. Optional: Automatic grade calculation based on the entered grades.</p> <p><b>Tools :</b> HTML/CSS, Javascript, ReactJS/NodeJS. (Choose any relevant frontend and backend tool)</p> <p><b>Databases :</b> (SQLite, MySQL, or MongoDB) for storing user credentials and course list, and course grade matrix.</p>	Sameer	6				
37	Exam APP (iOS support)	<p><b>Description:</b> Develop an iOS application that runs in kiosk mode, ensuring that the device is fully locked down to the app with restricted system access and communication functions.</p> <p><b>More Details:</b> [Sourcecode]</p>	Sameer	4				
38	IXTRAN Extensible Kernel Transport with eBPF	<p><b>Description:</b> Gain an understanding of Network stack. Analyze and reproduce the results posted in the paper and extend the same to your own environment. Implement the transport with various other scenarios.</p> <p><b>Tools :</b> C/C++/Python, Network Utilities</p> <p><b>Expected Outcomes:</b> Validation of published results, along with extended evaluation that highlights the impact of different network conditions and scenarios.</p> <p><b>Reference :</b> https://arxiv.org/pdf/2006.05261.pdf</p>	Sameer	4				
39	User Access Management Tool for Networked Devices Based on Allowed Time Slids	<p><b>Description:</b> User Access Management Tool is a web-based tool designed to control and manage user logins on devices (both local and remote) based on time-slot restrictions. The tool allows administrators to set specific time frames during which users can access devices. Access will be granted only if the user logs in within the specified time slot. This helps in better control and audit over device usage. This can be particularly useful for managing shared devices in an organization or for remote access management. The tool includes a user-friendly web interface (for ease of use) where administrators can configure allowed login times for each user, and a backend that enforces these time-based access restrictions on the devices.</p> <p><b>Tools :</b> HTML/CSS, Javascript, ReactJS/VueJS. (Choose any relevant frontend and backend tool)</p> <p><b>Databases :</b> (SQLite, MySQL, or MongoDB) for storing user credentials and login restrictions (time slots).</p> <p><b>Networking and OS tools:</b></p> <ul style="list-style-type: none"> <li>Linux/Windows CLI : For executing remote login commands (Ssh/WinSCP)</li> <li>Putty : For executing remote shell sessions (Windows) ; For enforcing login time restrictions on services.</li> <li>Cron Jobs (Linux) or Scheduled Tasks (Windows) : For managing scheduled access rules.</li> </ul>	Sameer	6
